

## Overview of Test Automation (Lunch and Learn)

Software testing is the process used to help identify the correctness, completeness, security, and quality of developed computer software. Testing is a process of technical investigation, performed on behalf of stakeholders, that is intended to reveal quality-related information about the product with respect to the context in which it is intended to operate. This seminar focuses on test automation. It provides an overview of the methodology and techniques surrounding test automation, and is not test tool specific.

Cardinal's clients have used the knowledge they have gained from this seminar to address the following issues:

- Identify projects that are candidates for test automation
- Reduce testing timelines which opens QA schedules for more test planning and execution

### Who Should Attend?

Software Testers, Test Managers, IT managers, project leaders and project team members who need to gain a better understanding of test automation techniques.

### Prerequisites

An understanding of software testing process is helpful, but not required.

### Topics Covered

- Types of Automated Testing
- Test case candidates for automation
- Documenting automated tests
- Automation and white box testing

### Materials Provided

Session manual

### Enrollment Details

Course Length: 3 hours (11:00 a.m.-2:00 p.m.)

Locations: Cincinnati, Columbus, Charlotte
